

## **They've Got Milk! 5 x PA 8 for Hansa-Milch**

Hansa-Milch AG in Upahl is expanding their production and ordered a highly flexible palletizing center from us for their new H-Milch (homogenized milk) filling.

We will be delivering five PA 8 high performance layer palletizers with our new ZF 52 infeed.

The ZF 52 was especially developed for the food and beverage market and is based on the time-proven ZF 50. The difference between the two consists in the fixed turning clamp. The turning station has no wiring harness and can be turned indefinitely without obstruction.

The product transport in the infeed station is done exclusively via module conveyors which the customer can easily remove for

cleaning and reinsert.

The unit comes right after the packaging machine and consists of 5 single-line production connections, i. e. each production line has its own palletizer.

The scope of delivery also includes bundle transportation as well as empty and full pallet transportation.

The central empty pallet supply from 3 pallet dispensers can hold up to 3 different pallet formats for palletizing. The 4-track technology installed in the empty pallet area makes it possible to use different pallet formats in the unit. In the case of half pallets two are placed onto a EURO pallet as carrier before proceeding to palletizing. The completed H-Milch pallets including the corresponding pallet data are then transferred to the connected stretch wrapper.
